

Casting repair is our passion!

Services

Our Service Department performs thousands of metal stitching and oven welding repairs every year. Casting repair is our business and our passion. From repairing cracked automotive cylinder heads to fixing a damaged 175,000 CFM blower, *LOCK-N-STITCH* Inc. will get the job done. On-site or in-situ as well as in-house machining capability gives us the ability to provide a complete repair package with a guarantee for the entire job. Our casting repair service department is ready to help you: in our shop, in the field, consulting, technical support, and engineering.

Experience

When you have us repair your parts, you will benefit from decades of experience. During these years we have successfully repaired thousands of castings. This experience is our most valuable asset. Because of the many different types of parts we've repaired, we have the ability to interlink thousands of individual experiences, successes, and, yes, even some failures to develop methods, techniques, and processes that work the first time - every time!

Craftsmanship

Our repairmen are true metal craftsmen. Each is a skilled machinist and welder. They are carefully trained in the art of cast metal repair. Cast iron is our main focus. It takes a special type of person to do this kind of work. It can be hard, dirty, and challenging. Pride in our work is often our greatest reward. Our intent is simple: *Do the very best job possible*. Attention to details, lots of patience, and excellent metal-working abilities have been keys to our success.

Creativity

Our latest technical breakthrough is a totally new approach to metal stitching called *CASTMASTER™*. This incredible new technology utilizes a thread design called *Spiralhook™*. These stitching pins draw the surrounding material together to re-establish original strength even in the most difficult conditions. The *CASTMASTER™* technology is the single most important development to date in the history of casting repair.

Machining

Machining is a very important part of any repair. We have the ability to machine all types of surfaces with the most modern and technically advanced machinery on the market. And we can do the machining on-site or in our shop. This is a great savings of time and cost for our customers.

Important

Please call us first when you discover the problem and especially *before* any repair attempts are made. We can save you thousands of dollars and hours of production. In addition, we sell our products and can train your personnel to perform *LOCK-N-STITCH®* repairs.
